

1. We want to create an app to curate a customized set of images, videos, and GIFS that will match your mood based on your social media posts and interests. The app will allow users to share posts that they liked. Our app will use a database to archive posts that were provided by the app which a user has liked or shared, in order to aid in finding the posts again. The app will decide what your current mood, emotion or interests are by using sentiment analysis on your tweets. Additionally, users could also choose a mood and a few interests instead of being affected by social media.
2. This app would take information about current movie listings at local theaters and recommend a movie to the user based on their interests from Facebook, Netflix and Twitter. If they decide they don't like the recommendation, they can use it indefinitely to recommend a different movie. The app will also allow users to link to a movie-ticket selling app where they can purchase tickets. The user can also state whether they liked or disliked the movie, which could help the app to fine-tune its future recommendations.
